Compression Spring Design. Compression springs apply a force by compressing or pushing on them. Our stock compression springs are all cylindrical and made out of round stainless steel or music wire. Compression springs can also be made in many shapes including barrel, conical, hourglass or oval. The wire can be also be square, rectangular or virtually any shape, size or material.

Several factors define the construction of compression springs and understanding these aspects makes it easier to get the best springs for particular devices. Compression Spring End Types. The ends of compression springs are some of the factors that determine what they can do and therefore, fundamental in the design process. A compression spring end will dictate its mounting characteristics, height, pitch and active coils.

This calculator computes all parameters (spring rate, maximum load, maximum stress, solid height, coil pitch, coil angle, wire length, resonant frequency, shear modulus, and spring mass) related to a compression spring from basic geometry and material data input.. In determining the total number of coils in the spring, the calculator assumes that the ends of the spring are squared.

When you have a compression spring which bends or buckles during deflection/travel, it means you have a high slenderness ratio. This is the proportional ratio between your spring ' s coil diameter and the free length. A spring with a free length more than three times longer than the coil diameter runs the risk of bending during deflection.
