Neural networks and back-propagation explained in a simple ...

Backpropagation is an algorithm commonly used to train neural networks. When the neural network is initialized, weights are set for its individual elements, called neurons. Inputs are loaded, they are passed through the network of neurons, and the network provides an output for each one, given the initial weights.

Backpropagation in Neural Networks: Process, Example ...

Backpropagation is a short form for "backward propagation of errors." It is a standard method of training artificial neural networks. This method helps to

Back Propagation Neural Network: Explained With Simple Example

Backpropagation in neural networks is about the transmission of information and relating this information to the error generated by the model when a guess was made. This method seeks to reduce the error, which is otherwise referred to as the loss function. How Backpropagation Works – Simple Algorithm

This is a very crucial step as it involves a lot of linear algebra for implementation of backpropagation of the deep neural nets. The Formulas for finding the derivatives can be derived with some mathematical concept of linear algebra, which we are not going to derive here.

Backpropagation is the heart of every neural network. Firstly, we need to make a distinction between backpropagation and optimizers (which is covered later).

Backpropagation is for calculating the gradients efficiently, while optimizers is for training the neural network, using the gradients computed with backpropagation.

Neural Networks: Feedforward and Backpropagation Explained

An artificial feed-forward neural network (also known as multilayer perceptron) trained with backpropagation is an old machine learning technique that was developed in order to have machines that can mimic the brain.

What Is Backpropagation? | Training A Neural Network | Edureka

In machine learning, backpropagation (backprop, BP) is a widely used algorithm for training feedforward neural networks. Generalizations of backpropagation exists for other artificial neural networks (ANNs), and for functions generally. These classes of algorithms are all referred to generically as "backpropagation".

Weights and biases in a network changes the cost function. Ultimately, this means computing the partial derivatives $\partial C / \partial w_{ljk}$ and $\partial C / \partial b_{lj}$. But to compute those, we first introduce an intermediate quantity, δ_{lj} , which we call the error in the j th neuron in the l th layer.

Backpropagation, short for backward propagation of errors, is a widely used method for calculating derivatives inside deep feedforward neural networks. Backpropagation forms an important part of a number of supervised learning algorithms for training feedforward neural networks, such as stochastic gradient descent.
