Before you start RMAN and connect to your Oracle database 12C, you need to ensure that you have the proper OS variables set and that you have access to an account with sys* privileges. Once those are in place, you can start RMAN and connect to your target database via the rman command-line utility. These are the same conditions that need to be in place before connecting to your database as a privileged user are described earlier in this blog .

Starting with Oracle Database 12 c Release 1 (12.1), RMAN can use backup sets to transfer the source database files that need to be duplicated. The backup sets are transferred over the network to the auxiliary database.

~~Duplicating a Database—Oracle~~

The control file does not have the data file record, that is, you did not back up the control file after data file creation. During recovery, the database detects the missing data file and reports it to RMAN, which creates a data file and continues recovery by applying the remaining logs.

~~Performing Complete Database Recovery—Oracle~~

When you transport an entire database to a different platform, the source platform and the destination platform must use the same endian format. To migrate Oracle Database 12c on-premises tablespaces to an Oracle Database 12c database on a Database service deployment using the RMAN cross-platform transportable backup sets method, you perform these tasks:
