That means you need two amplifiers; one for surround sound and another for stereo. The surround amplifier (or receiver) needs to have pre-outs for the front-left and front-right speakers that bypass the unit's own power amplification and output an analogue signal to the stereo amp. Pre-outs are pretty common on AV amps above £500 (we've listed some current models below).

In these systems, the subwoofer is wireless, but the surround speakers connect to the subwoofer via speaker cables. The soundbar produces the sound for the front left, center, and right channels, but sends bass and surround signals wirelessly to the subwoofer. The subwoofer routes the surround signals to the connected speakers.

Thick wire (12 or 14 gauge) is recommended for long wire runs, high power applications, and low-impedance speakers (4 or 6 ohms). For relatively short runs (less than 50 feet) to 8 ohm speakers, 16 gauge wire will usually do just fine. It's cost-effective and easy to work with. Ask your advisor to recommend the proper gauge for your installation.
